Wiring for Dual Voltage Motors:

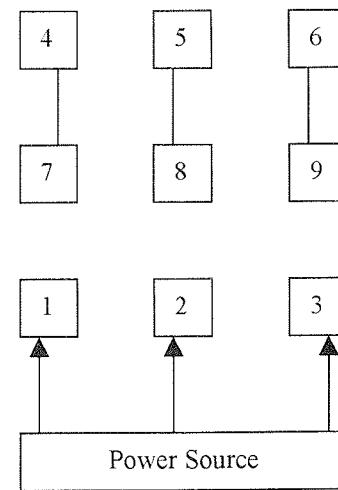

WARNING: Disconnect all power source before changing any wires.

1. Most spindle motors are interchangeable between 220V and 440V. To change wiring, follow the instructions below.
2. After disconnecting the power, remove cover on the motor. The diagram below should appear on the inside. If in doubt about the electrical wiring please consult a qualified electrician or Sharp Industries, Inc. for advice.
3. After making the connections as illustrated below, check that all connections are tight and properly isolated, replace cover and apply power.

220 Volts

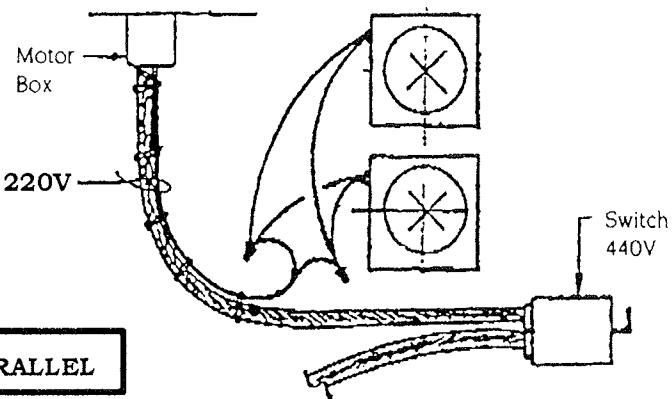

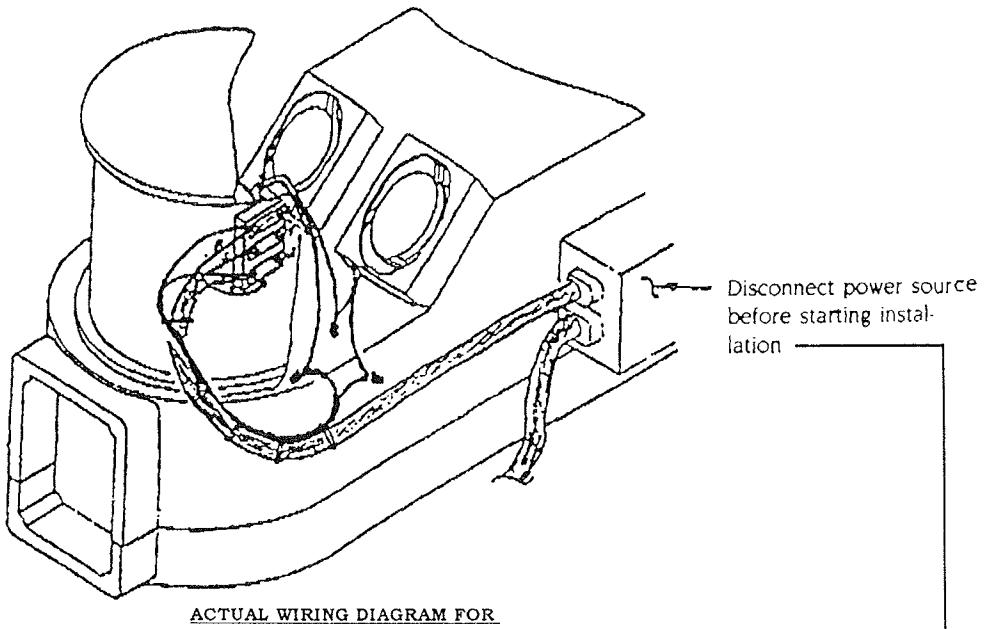

440 Volts

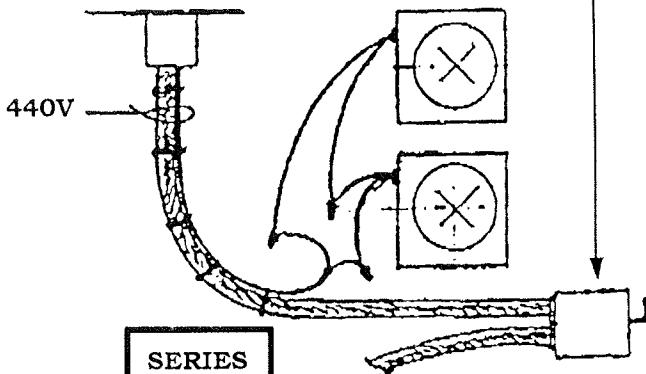

TWIN COOLING FAN WIRING DIAGRAM

CAUTION
Follow wiring
instruction
carefully!

WIRING 220V POWER TO TWIN 220V COOLING FANS

WIRING 440V POWER TO TWIN 220V COOLING FANS

1. Warning: Disconnect power source before starting installation
2. Caution : Follow wiring instruction carefully
3. For trouble shooting, use a meter to check the current. Do not use the 440V current to check the fan individually.
4. This method of connecting the fans in series to run on 440V current is only applicable to the Twin Fan Model. Do not use it on the Single Fan Model.

1. Forward:

SHARP LMV milling machines are designed and manufactured to meet the demands of our customers. All parts and materials have been placed under strict quality control to ensure the superior quality and durability.

This manual gives a detailed account of the structure, mechanism. Methods of operation and maintenance of the LMV mill. To insure the maximum performance and precision operation, it is imperative that operators, maintenance and repair personnel read the manual thoroughly and follow the specific instructions in operating and maintaining the machine.

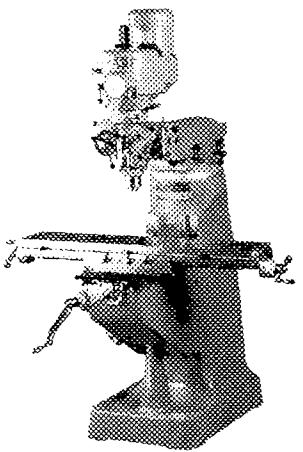

2. Safety Rules and Regulations:

1. Do not wear loose clothing when operating the machine.
2. Operators shall wear goggles and safety boots.
3. Do not disturb the operator when the machine is running.
4. Caution should be taken when removing chips from work surface.

3. Notice:

Retrofitting the Sharp Mill with a CNC control, such as Sony, AcuTire, Anilam or other similar controls without the installation of an approved auto-lube system will void the warranty on that machine.

SHARP VARIABLE SPEED MILLING MACHINE

1. Specifications:

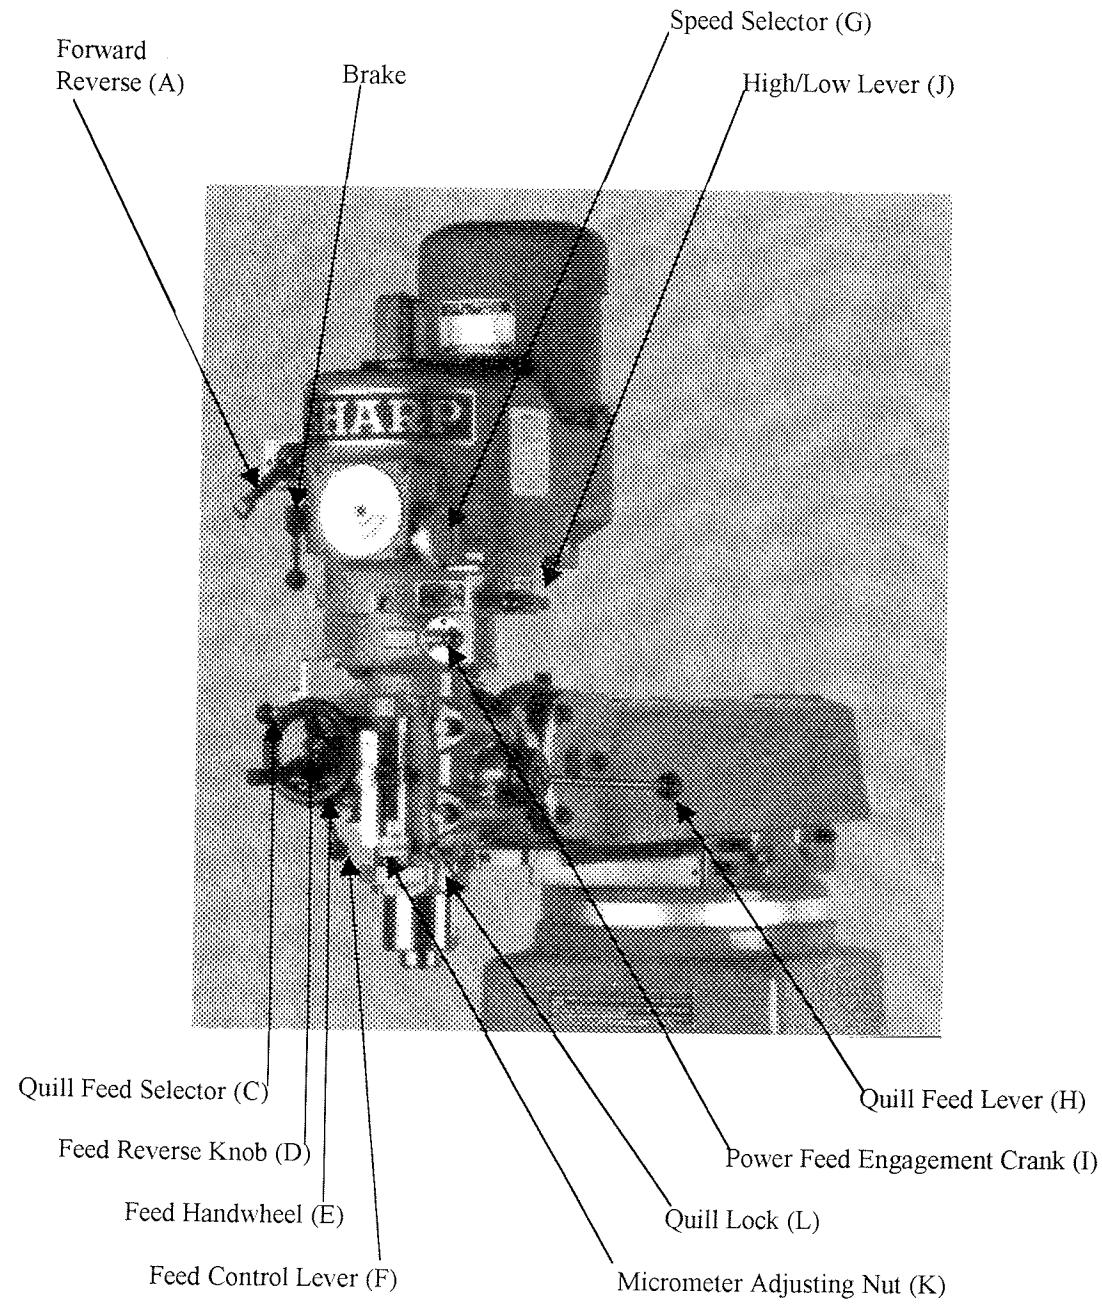

STANDARD						
SPECIFICATIONS	INCH	MM	SPECIFICATION	INCH	MM	
WORK TABLE						
Working area of table	42 X 9	1067 X 230	Spindle speed	50HZ	50 - 3750 rpm	
Table Travel	30	762	RPM	60HZ	60 - 4500 rpm	
Saddle Travel	12	305	Machine net weight		2,400lbs 1,010Kg	
Knee travel	16	406				
HEAD						
Motor	2HP 3HP					
Spindle taper	R8 or N.S.T. #30					
Quill Travel	5	127				
Feed rate Per revolution	.0015, .003, .006	.04, .08, .15				
OPTIONAL						
Working area of table	49 X 9	1225 X 230	Table travel (Hand)	36 1/4	933	

2. Machine uses:

1. Drilling
2. Milling
3. Molding
4. Polishing
5. Boring

3. Machine Parts:

1. Headstock:

2. Machine Body:

1. Column, Turret and Ram:

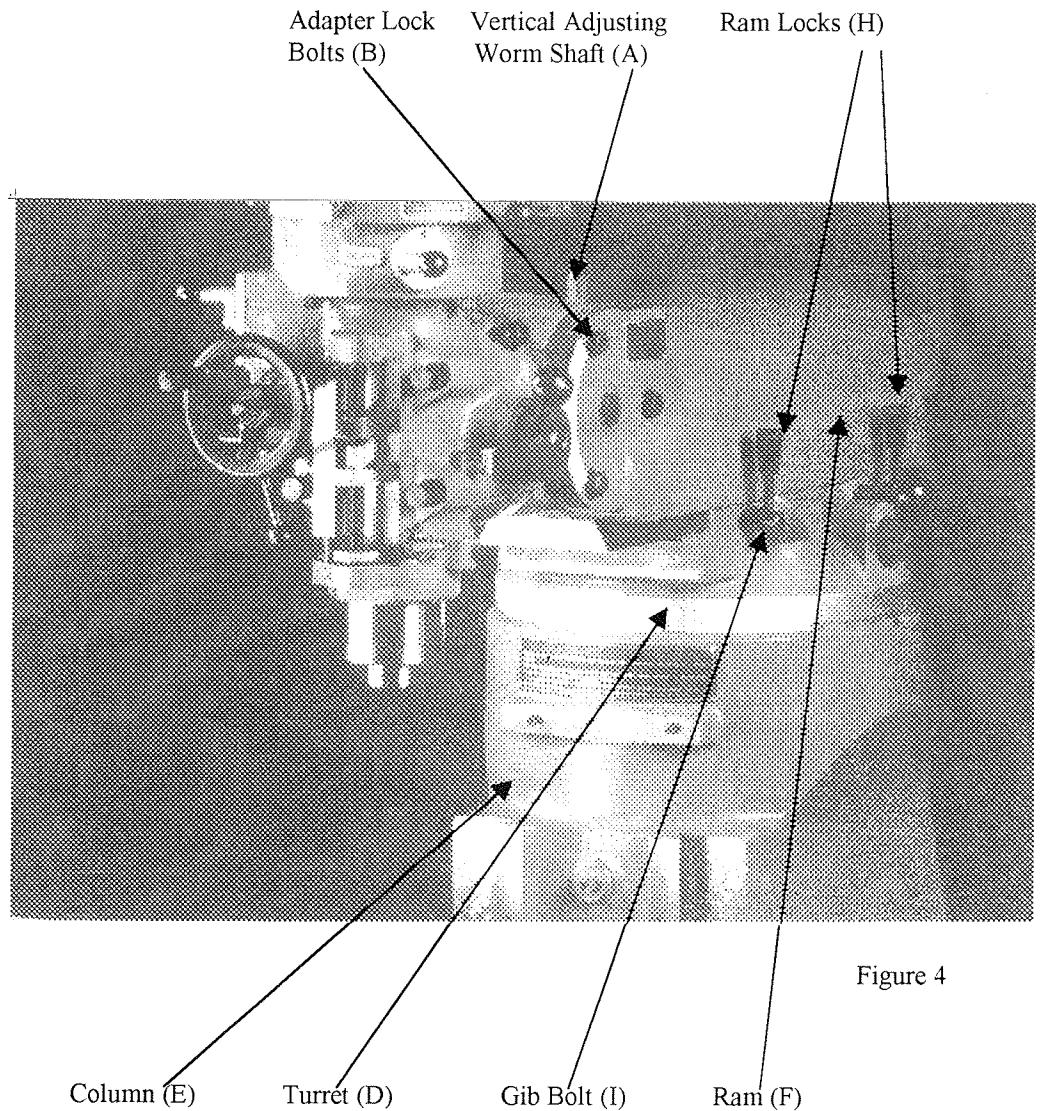

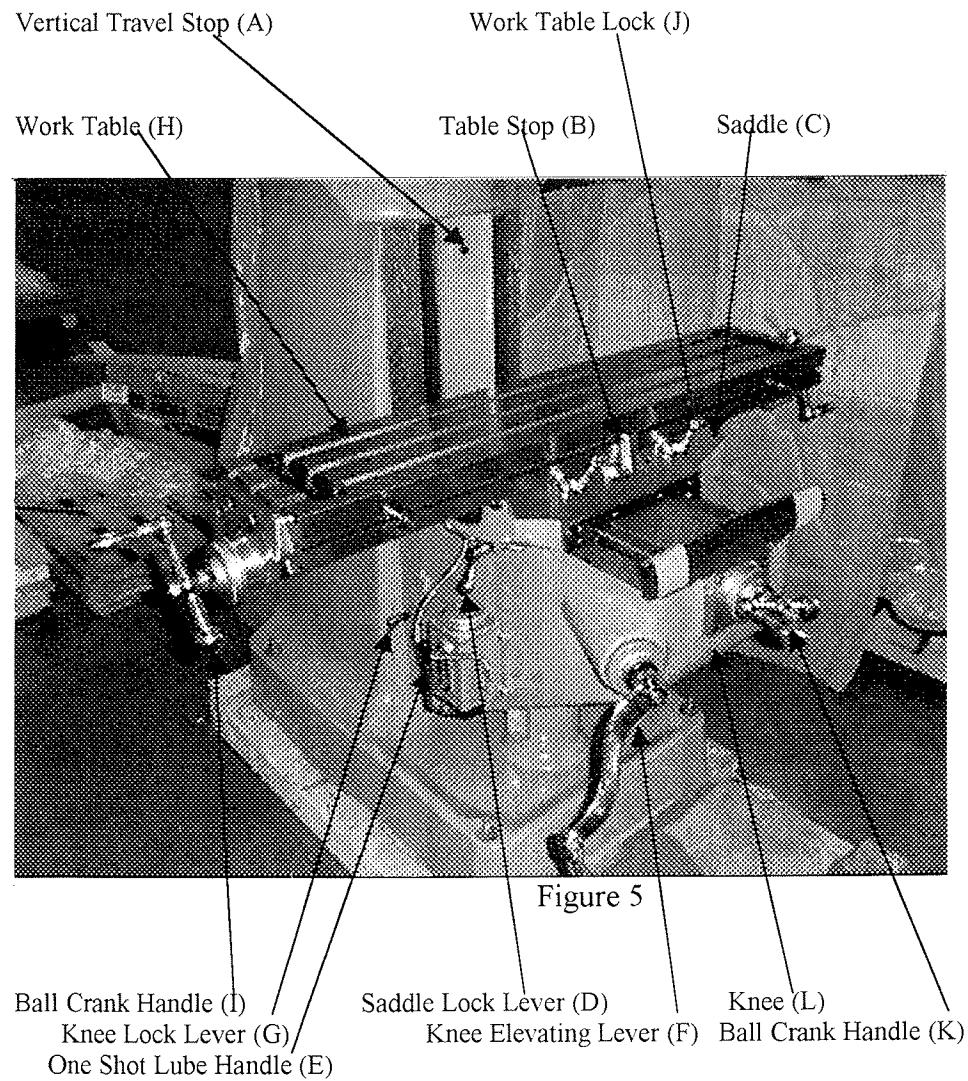

Figure 4

2. Table, Saddle and Knee:

4. Headstock Cooling System:

The variable speed headstock is equipped with a unique cooling system. Two fans have been installed outside of the cover between the front and rear speed change wheels. The purpose of the fans are, to dissipate the heat build up between the belt and the speed change wheels, and prolong the life of the mill.

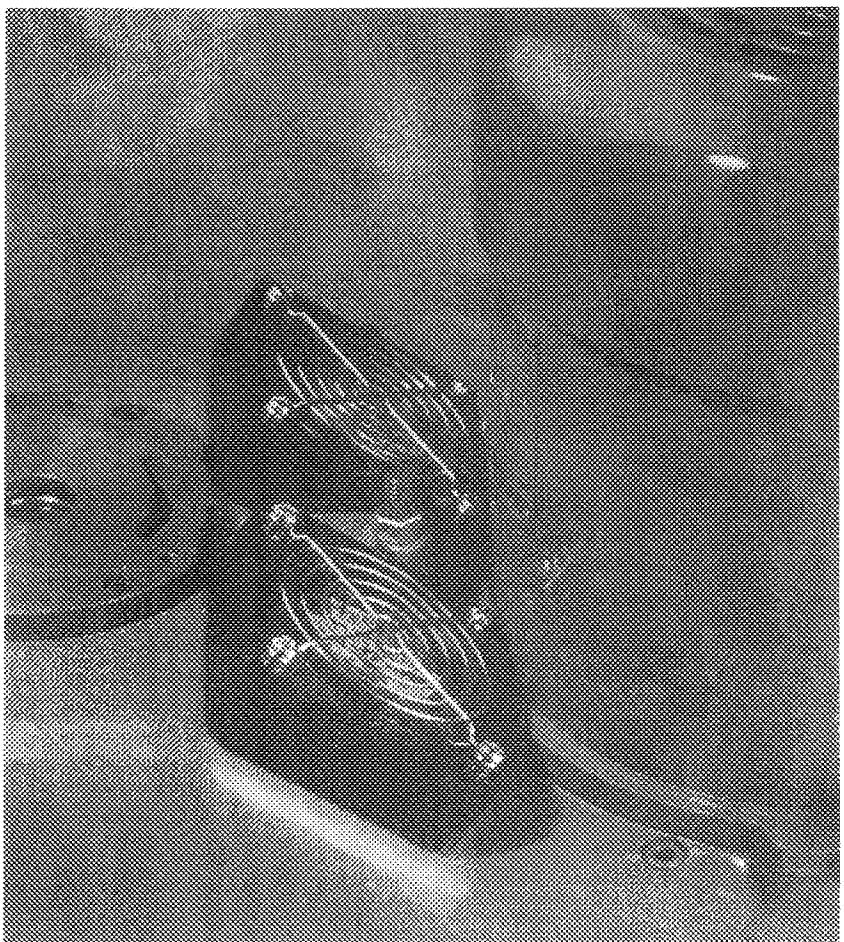

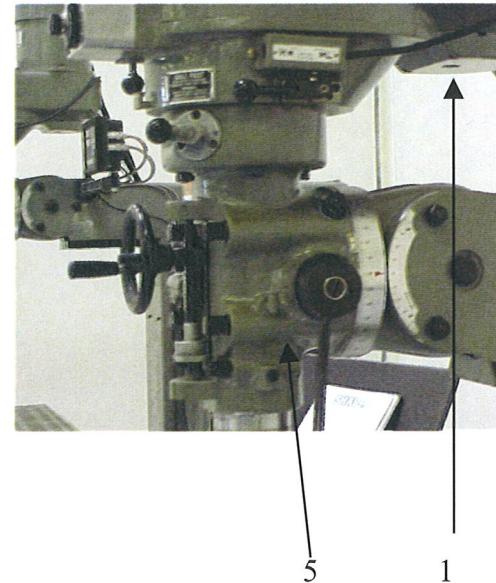

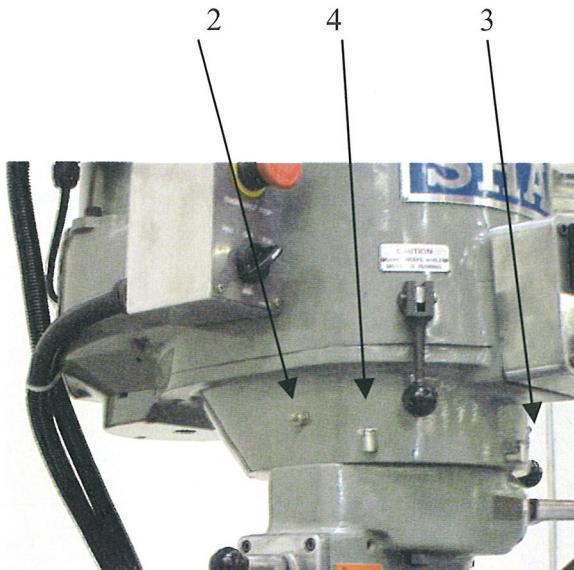

Figure 6

5. Lubrication:

1. Head

Position	Type	Lubricant	Frequency	Function
1	Grease	Multi-Purpose Grease	One Shot Every 3 Months	Motor Shaft
2	Grease	Multi-Purpose Grease	As Needed **	Bull Gear
3	Oil Cup	Shell Tonna 33	Twice a Week	Bull Gear Bearing Shaft
4	Oil Cup	Shell Tonna 33	Daily	Worm gear Cradle
5	Oil cup	Shell Tonna 33	Twice a Day	Quill

2. Table, Saddle and Knee

Position	The ways, saddle, knee and leadscrews are oiled by means of a manually operated pump, located on the left side of the knee.
Frequency	2 pumps 3 to 5 times daily
Lubricant	Shell Tonna 33

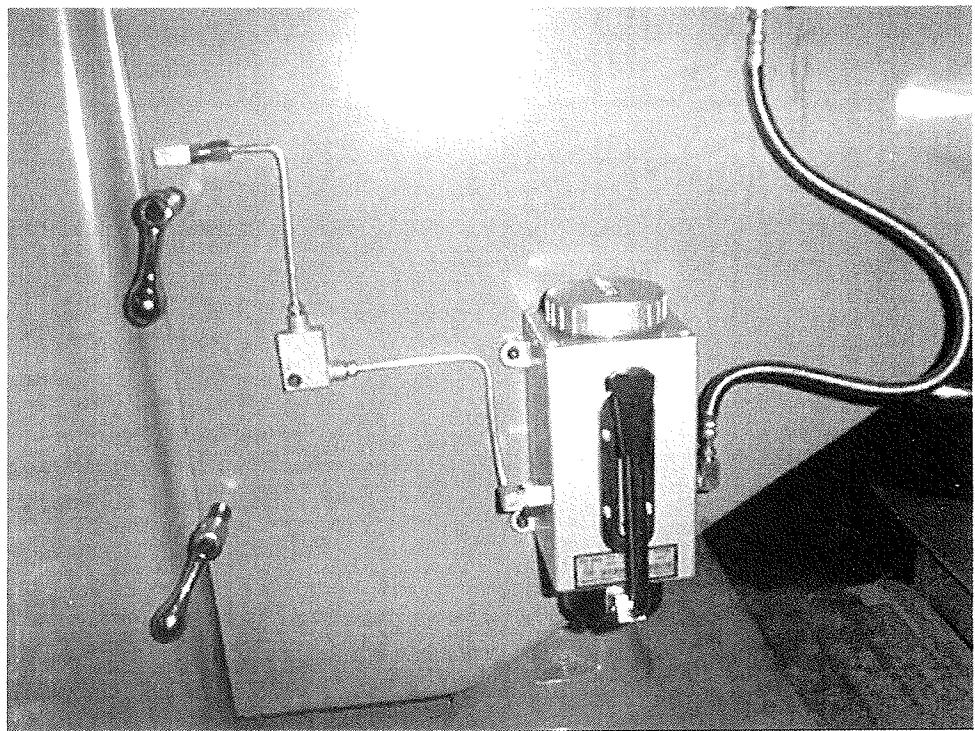

Figure 8

6. Operation:

1. Headstock:

- a. Power to the motor is controlled by a three way switch, forward, reverse and off. (Fig. 9). When the high-low speed change lever (fig. 3 (J), Page 3) is in high gear position and the switch is in FOR., the spindle rotation is clockwise, when the switch is in REV. the rotation is counter clockwise.

Note: When the high speed change lever is in low gear position the rotation of the spindle is the opposite from above.

b. Spindle Brake:

To prevent damage and prolong the life of the brake, the power must be off and the spindle speed must be below 200 RPM before engaging brake. The brake can be engaged by pushing or pulling the brake lever. (Fig. 10). Pulling the brake lever up after it is engaged can lock the brake. **Caution:** Be sure the brake is in neutral before starting the spindle.

c. Installation of collet:

1. Raise the spindle all the way up.
2. Insert collet, being sure the keyway lines up with the pin in the spindle.
3. To tighten turn the drawbar clockwise while brake is engaged. To remove collet, loosen the drawbar (counter clockwise) three to five turns and tap the drawbar with a soft mallet to break the collet loose from the taper.

NOTE: When the mill is fitted with the R8 spindle, care must be taken that the collet keyway is aligned with the pin in the spindle. (Fig. 36, Page 35)

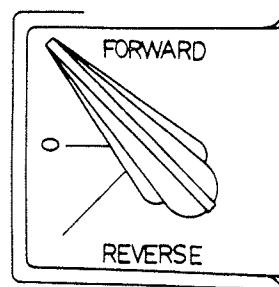

Figure 9

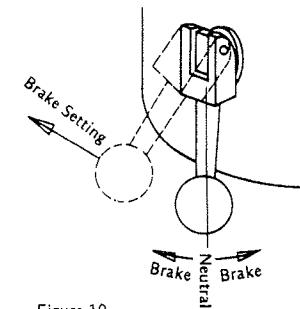

Figure 10

d. Manual feed:

The manual feed lever is located on the right side of the headstock (Fig. 3 (H), page 3). This lever controls the vertical movement of the spindle. For the Operator's convenience the lever can adjusted as needed.

Note: In manual feed, the feed control handle "F" (Fig. 11) must be in the "F1" position.

e. Manual Micro-feed:

To use the manual micro-feed, the power-feed transmission lever (J) (Fig. 11), must placed at the "OUT" position and the feed reverse knob (D), (Fig. 11) must be in the neutral position. To engage the overload clutch, lever "F", (Fig. 11) must be moved to the "F2" (Fig.11). You can now turn handwheel "E" clockwise to lower the spindle, counter clockwise to raise it.

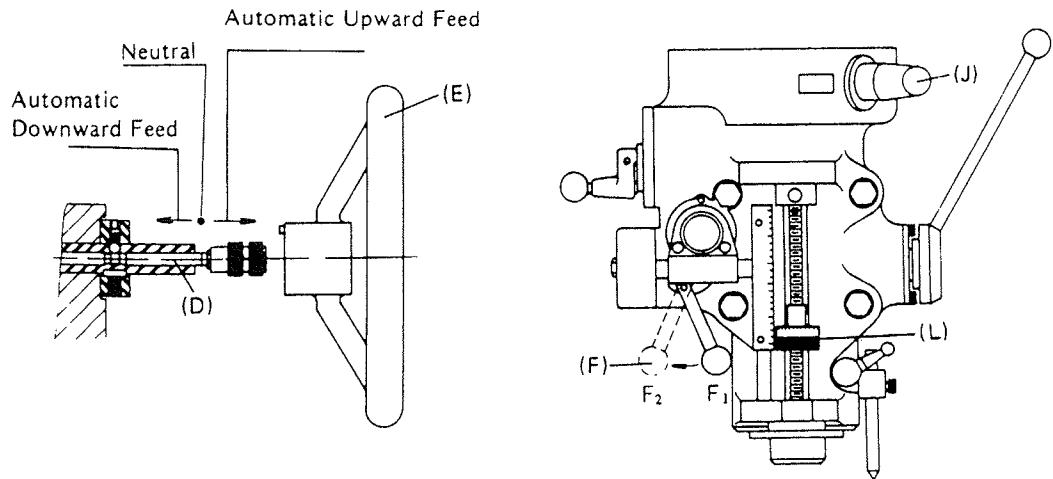

Figure 11

f. Automatic feed:

Procedure for using this function is:

- a. Loosen the quill lock "L" (Fig. 3, Page 3)
- b. Place the power feed transmission lever "I" (Fig. 3, Page 3) in the "IN" position.
- c. Place feed speed lever "C" (Fig. 3, Page 3) in the desired position. (H, L or M).
- d. To engage the overload clutch, place feed control lever "F" to the "F2" position. (Fig. 12).
- e. The quill will move down when Pressing knob "D" (Fig. 11) in, and pulling it out, the quill will go up. (The middle is neutral).
- f. The working depth can be set by use of the micrometer adjustment nut "K" (Fig. 12). This adjusting nut is graduated in .001" and .02mm increments). To activate the auto feed, pull the feed control lever "F" out. It will disengage when the adjusting nut contacts the quill stop block "I" (Fig.12). For manual trip, you can push the feed control lever in manually.

Note: 1. Maximum drilling capacity for automatic feed is 3/8" or 10mm.

2. The power feed transmission lever "I" (Fig. 3 Page 3) should be in the "OUT" position when the power feed is not being used. To avoid damage to the gears, **do not** engage the power feed when the spindle is running.

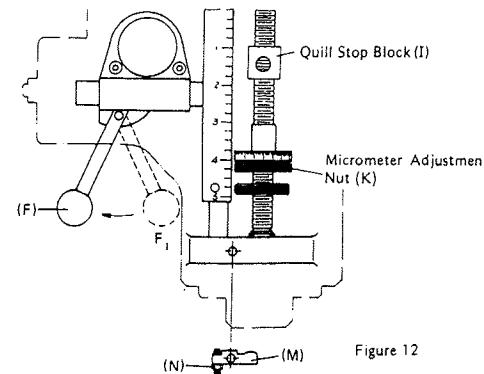

Figure 12

g. Spindle speed change:

The speed of the spindle is controlled by a set of sliding belt pulleys and a counter shaft gear. There are two options. (High and Low). High gear is for RPM from 500 to 3,000 and low gear for RPM from 60 to 580. When high – low lever “J” (Fig. 13) is in the forward position it is in high gear, when facing back it is in low gear.

Note: To change from high to low:

- a. The spindle must be stopped.
 - b. Moving the spindle slightly by hand when shifting from high to low makes it easier for the gears to engage. You will feel a click when it engages.
 - c. The direction of the spindle is reversed when in low gear. This can be overcome by use of the “FOR” “REV” switch.
- h. Speed change handwheel
- a. Do not change speed when spindle is stopped.
 - b. Do not run spindle in excess of 3,000 RPM.
 - c. Slow speed changes are advised, to prevent premature wear on the belt, pulleys and other internal parts.

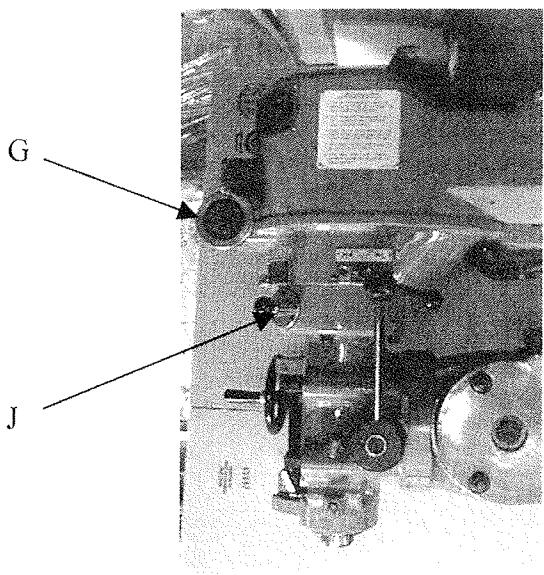

Figure 13

i. Tilting the Headstock (Fig. 14):

To tilt the head up or down, evenly loosen the three adapter locking bolts (P) and move to desired angle using adjusting worm shaft "Q". Re-tighten the adapter bolts. NOTE: Do not remove adapter bolts.

Cross Tilting the Headstock (Fig. 15 & 16);

Evenly loosen the four lock nuts "R". Using the worm shaft "S" move head to desired angle and retighten lock nuts. NOTE: For angles greater than 30 degrees, the safety pin "T" (If equipped) must be removed.

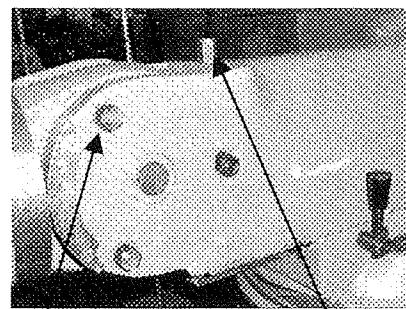

Figure 14
(P) (Q)

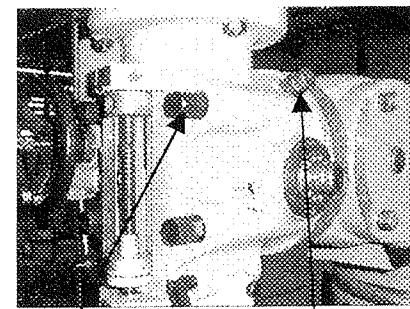

Figure 15
(R) (S)

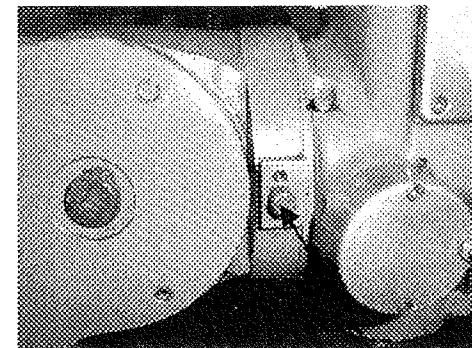

Figure 16
(T)

2. Machine Body Operations:

1. Ram Movement (Fig. 17):

- a. To move ram in or out, loosen Ram lock levers "A" and move to desired position using handle "B" and retighten levers.
- b. To swivel ram, loosen the four bolts "C", move to desired position and retighten bolts "C".

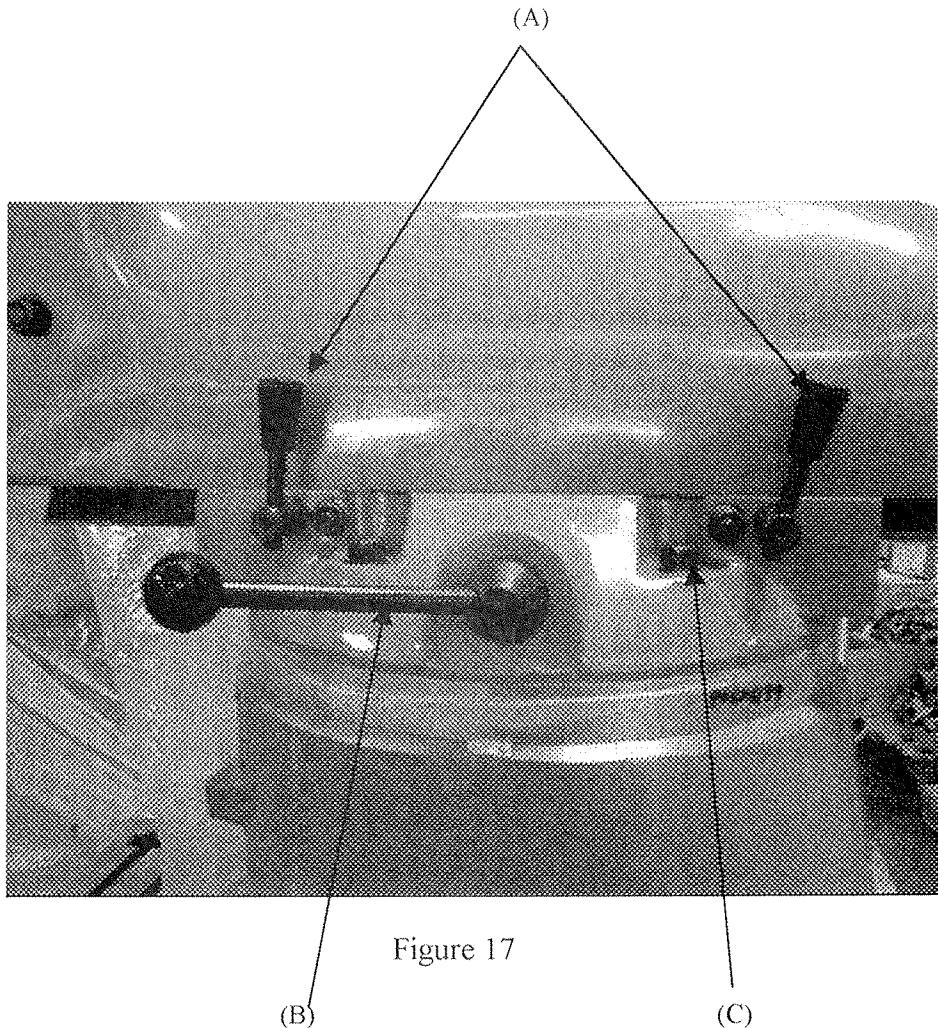

Figure 17

2. Setting hand wheel dials to zero (Fig. 18):
 - a. Loosen lock ring "D".
 - b. Turn dial "E" to zero and tighten lock ring "D".
3. Locking the table, saddle and knee:

To increase the stability of the mill and maintain a good workpiece finish, all non-feeding surfaces should be locked down. See Fig. 19 for location of locking levers.

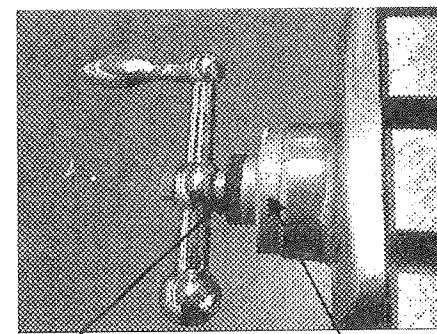

Figure 18

(D)

(E)

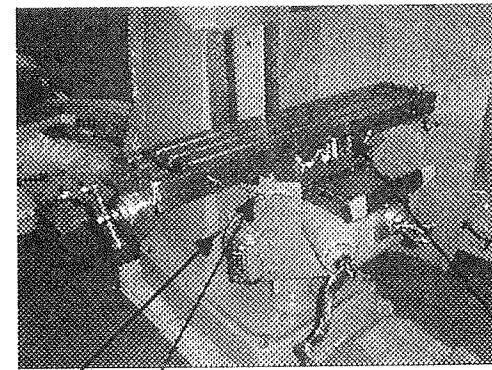

Figure 19

Knee Lock Lever

Saddle Lock Lever

Work Table Lock Lever

7. Unpacking, moving and floor space:

a. Methods of moving machine:

1. Prior to unpacking or removing from skid, the machine should be moved by use of a forklift or reinforced cable. (Fig. 20 & 21)
2. Removal from the skid and any further movement of the machine should be done by use of a reinforced cable or by the eye bolt located in the top of the ram.

Remarks:

1. When lifting or moving machine be sure area is clear of all personnel.
2. Lifting machine by use of the eye bolt should be done only when absolutely necessary.
3. When lifting or moving the machine before unpacking or removing from the skid, observe any precautions or instruction that may be printed on the crate.
4. The machine can be balanced while being moved by changing the location of the table and or saddle.
5. Do not attempt to raise the machine too high. The recommended height is approximately 10cm from the ground.
6. If the machine is not stable when being lifted, adjust the rigging as needed.
7. Only use qualified forklift operators to move the machine.

DVS HEAD CONTROLS

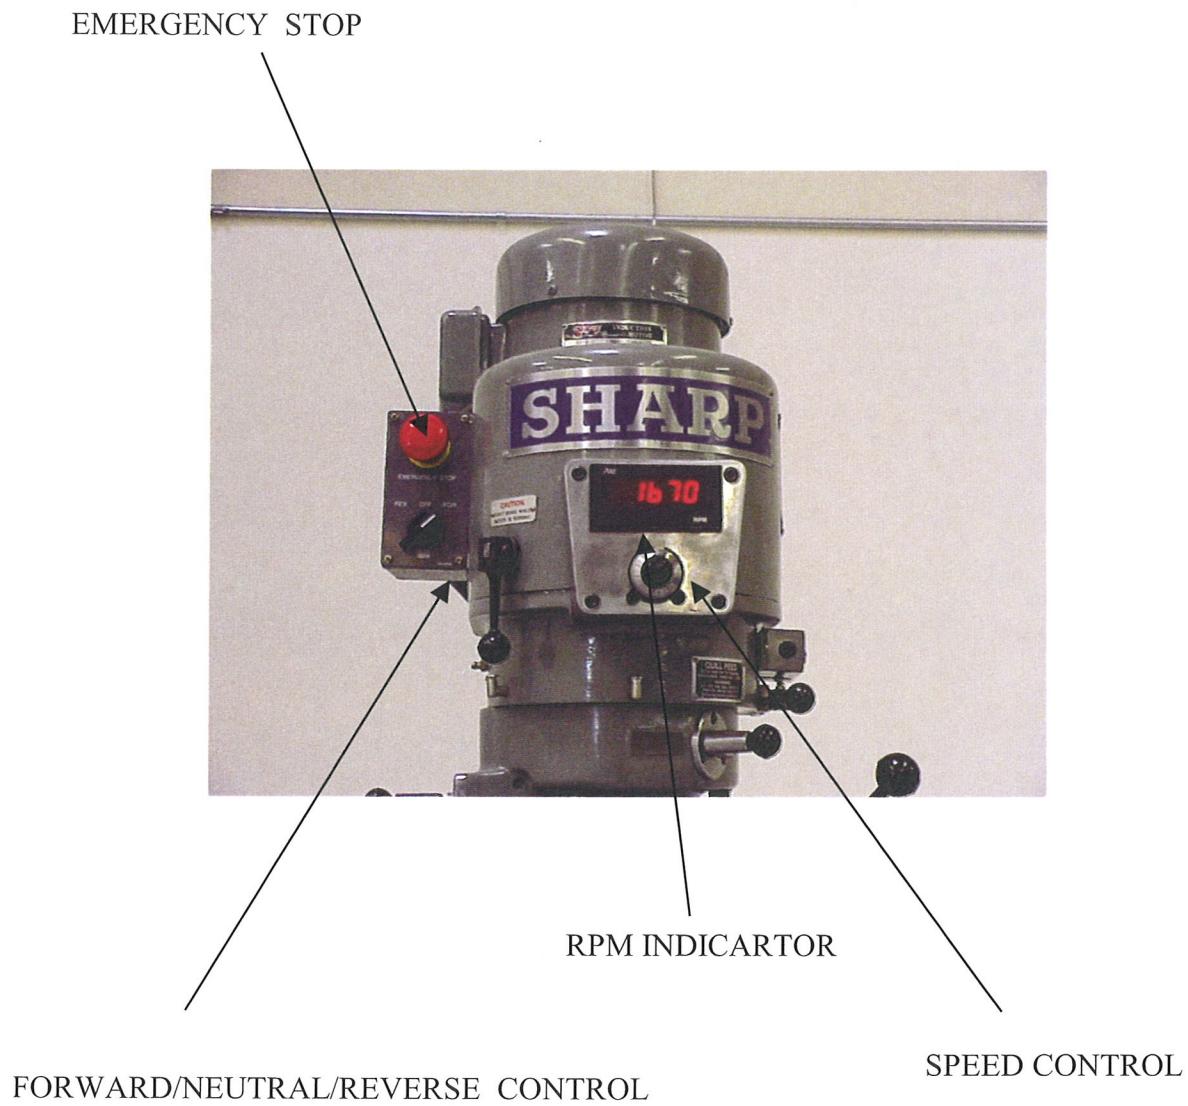

Figure 20

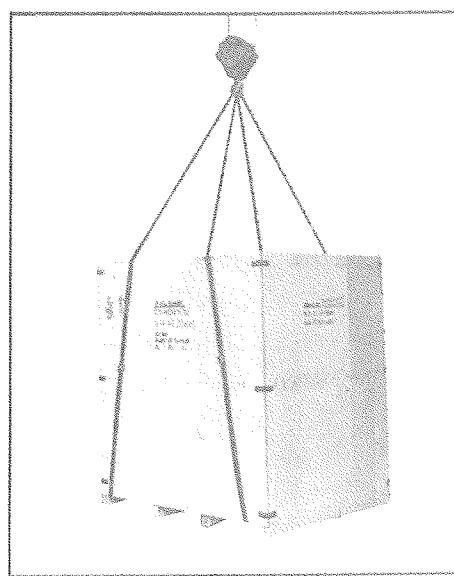

Figure 21

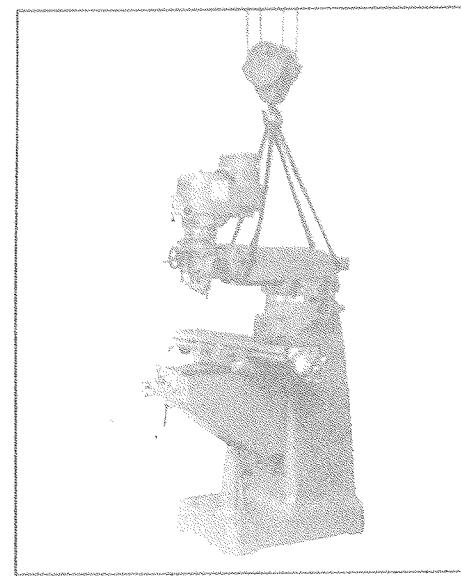

Figure 22

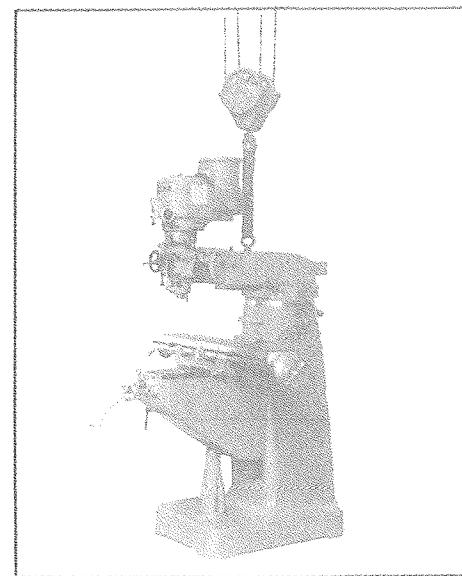

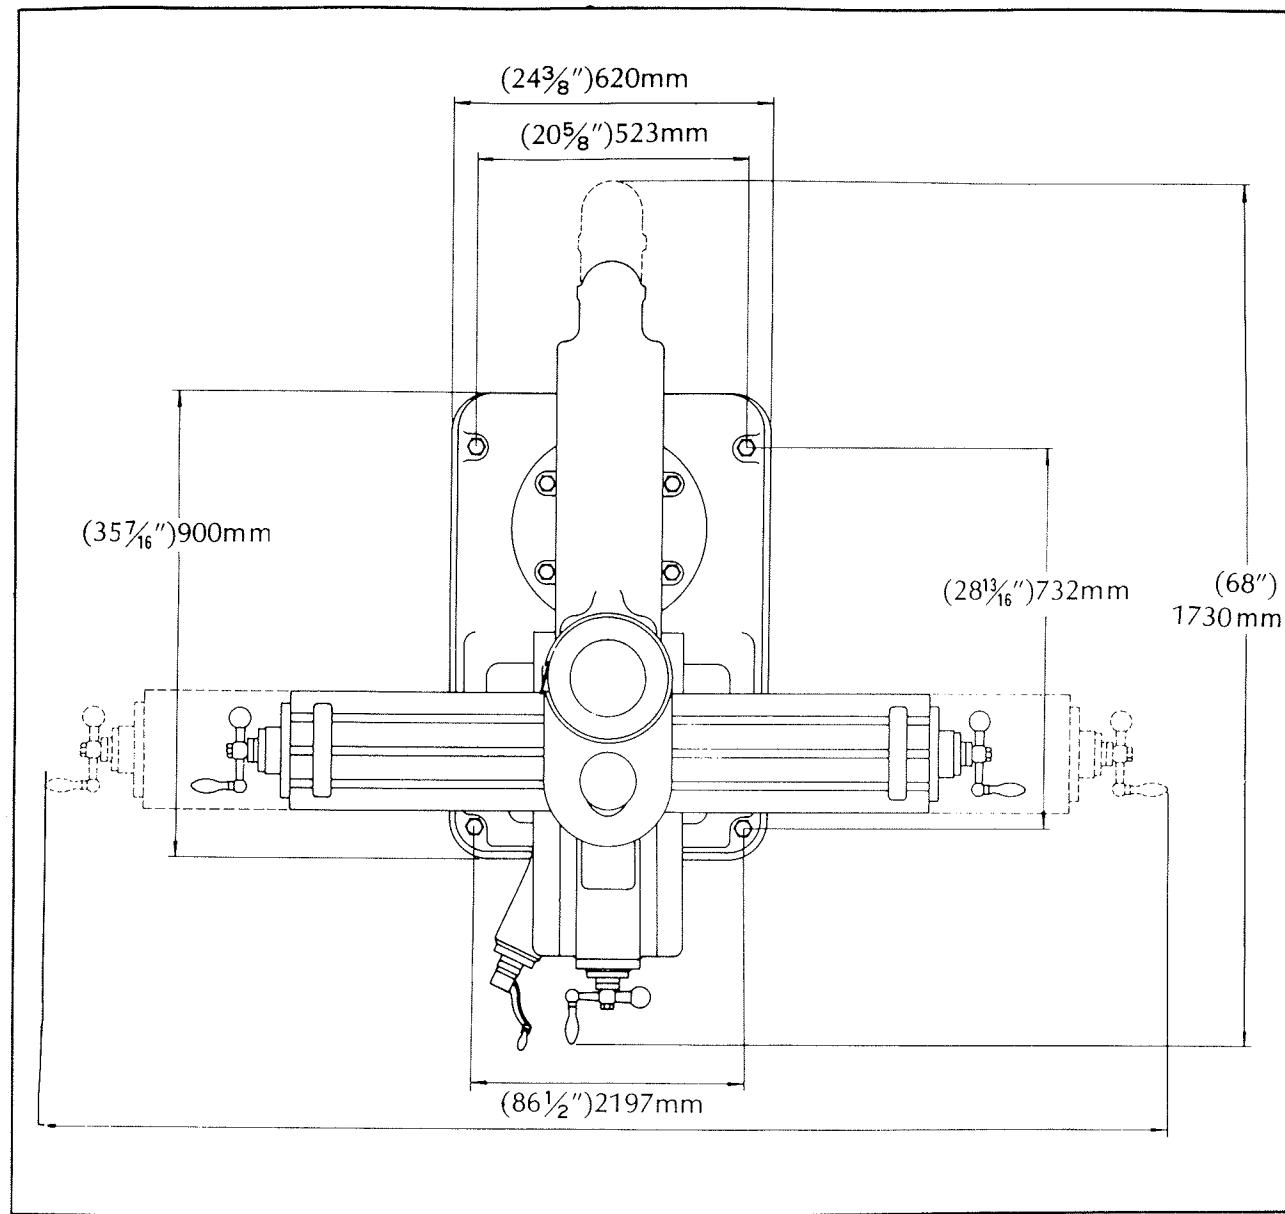

Figure 23

b. Unpacking:

1. To protect the machine while in transit it is necessary to cover it with a rust proof coating and a crate or plastic wrapping. In the event there is damage due to moisture, please contact our agent or the transporter.
2. After unpacking, make sure all tools and accessories are intact. If not contact our agent.
3. Restore headstock to its normal position. (Fig. 3 Page 3)
4. Do not move the sliding surfaces until all of the protective rustproof coating is removed and all surfaces are well oiled.
5. Do not remove the oil wipers when cleaning the machine.
6. Do not use gasoline or other flammable cleaners.

(C) Floor Space:

(D) Machine Height: 2070 (81 $\frac{1}{2}$ ')

7. Machine Alignment:

Maintaining close tolerances and proper alignment of the machine is critical to producing quality-machining results.

Please see the following Table of Precision Inspection.

Variable Speed Head Troubleshooting

Problem	Possible Cause	Solution
Consistent noise in both High and Low Gear (Quiet in Neutral)	Upper and lower head not Aligned Spindle spline and hub do not match Spindle bearings (If finish is poor)	Align Replace either to match Replace H348 spindle bearing set or H349 top bearing if no chatter is present
Noise in High Gear, Low Gear & Neutral Noise at all speeds	Noise frequency follows the speed Noise frequency does not follow the Speed	Replace spindle pulleys and H522 bearings Replace motor bearings/Motor
Noise in High Gear only	Worn clutch Clutch out of adjustment	Replace H561 & H572 Adjust position of H/L lever
Noise in low gear only	Bull gear Timing belt Timing pulley bearing	Lubricate bull gear Hold brake & turn spindle by hand, if more than $\frac{1}{4}$ turn Replace timing belt Replace bearing H301
Noise when quill is out	Twisted spindle Alignment of H & L head if noise Depends on position of spindle	Replace spindle Align head

Variable Speed Head Troubleshooting

Problem	Possible Cause	Solution
Intermittent Noise (Comes & goes) Noisy on first start up, goes away after 10 To 20 minutes.	Drive belt stiff from sitting overnight	Normal
High pitch shriek when start up over 2500 RPM	Motor shaft needs lubrication	Lubricate motor shaft. (Do not over-grease Excess lubrication will cause belt to slip)
Vibration and noise in all speed and gears	H531 key too tight	Check key for proper clearances or replace
Noise in H/N/L at any speed, with a constant pitch .	Worn or defective motor bearings	Replace motor bearings

Variable Speed Head Troubleshooting

Problem	Possible Cause	Solution
Auto Quill Feed does not work: Wheel responds to feed reverse knob but Does not feed	Damaged worm gear	Replace worm gear (H060) and check for alignment.
Auto feed only works in one direction	Broken bevel gear	Replace bevel gear (H115 or H110)
Feed select does not engage	Broken gears	Inspect H102, H104, H126, H324 and H327 (Replace as needed)

8. Trouble shooting:

1. Removing Motor: (Fig. 25)
 - a. While running motor reduce speed to 60RPM. This will lower the stationary motor vari-disc to its lowest position.
 - b. Temporarily disconnect the power source.
 - c. Remove motor pulley cover "B" under the motor shaft, remove grease fitting. Use 2 of the screws to insert into the pulley spring washer/plate "D", taking care to tighten evenly.
 - d. Connect the power and increase the RPM to 3000, which will raise the motor vari-disc to gain access to the snap ring "G".
 - e. Disconnect the power.
 - f. Remove snap ring "G".
 - g. Remove the two motor mounting bolts "H". You can now remove the motor. (The lower pulley and spring assembly will slide out and remain in the housing).
 - h. Reverse above procedure to re-assemble.

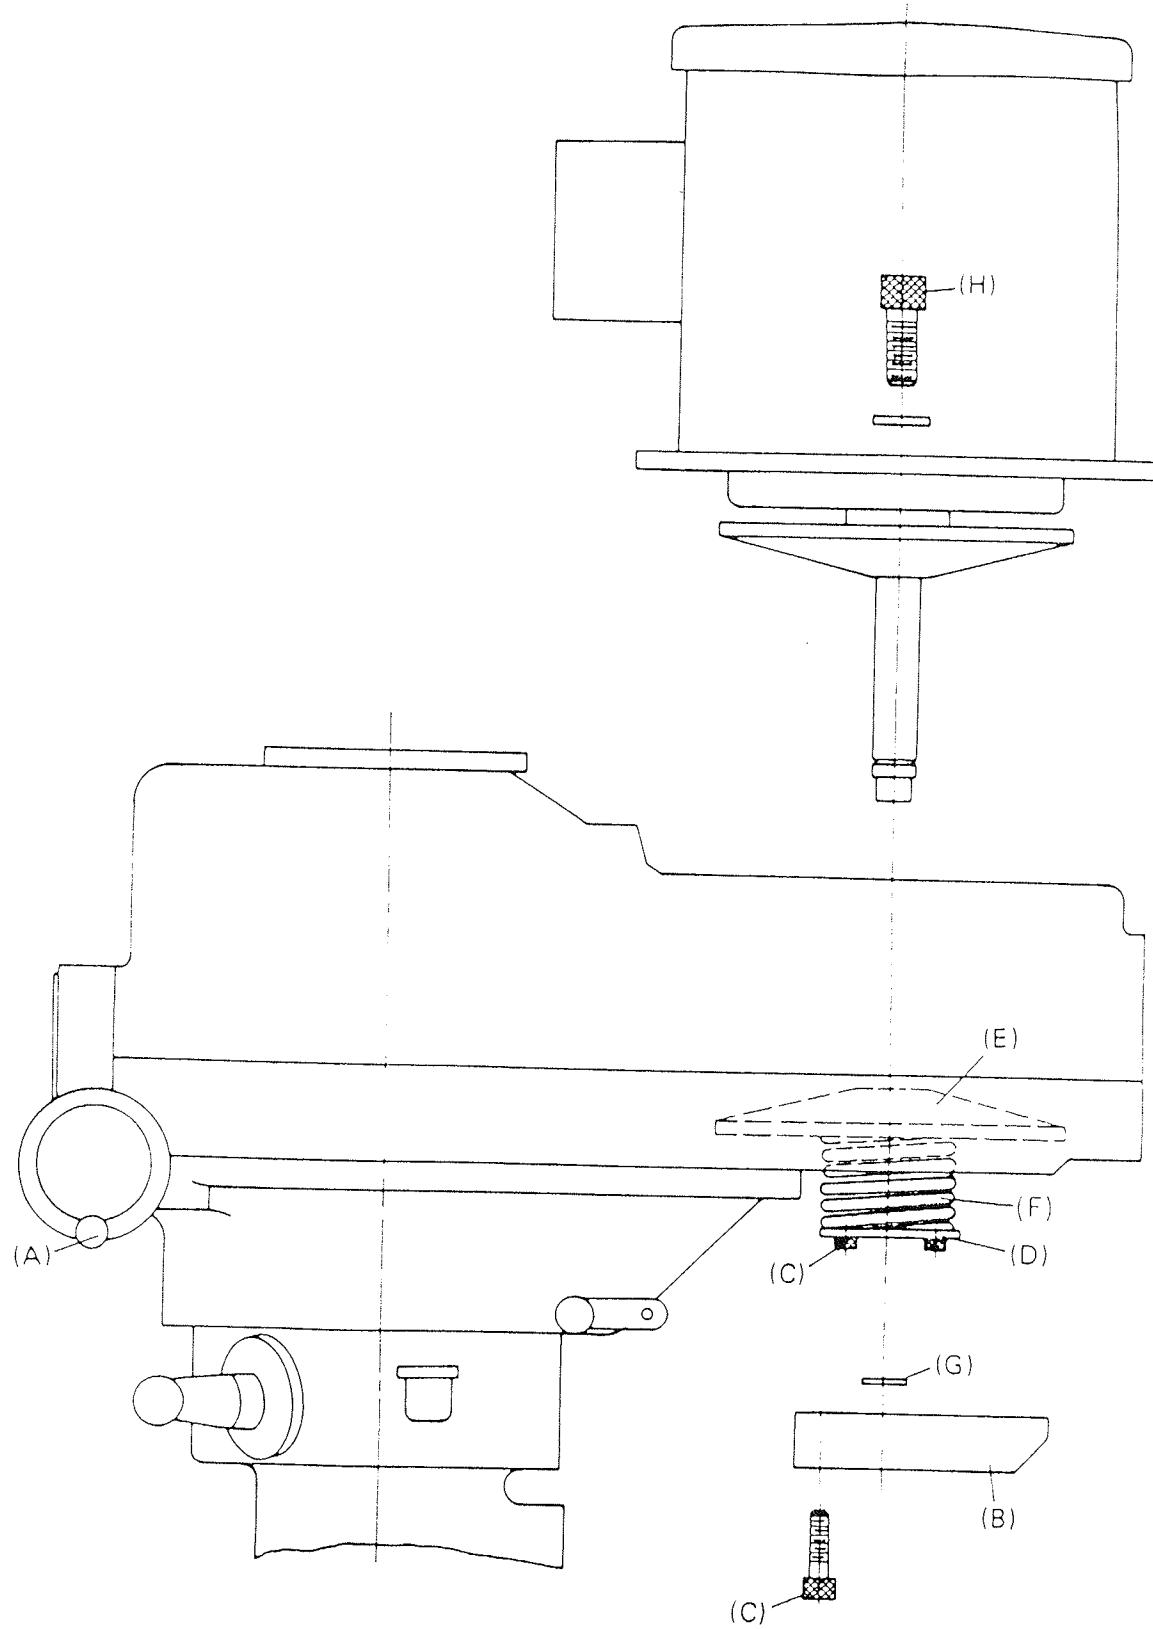

Figure 25

2. Replacing the Speed Change Belt: (Fig. 26)
 - a. Refer to steps a to g on page 24 for removing motor.
 - b. Remove draw bar.
 - c. Remove bolts "J" from bearing housing "K". Use 2 of the bolts to push housing off of the housing "T".
 - d. Remove the 2 bolts "L" and sleeves "M" that hold the speed change plate.
 - e. Remove "N", "O" and "P". (Total of 6 bolts).
 - f. Remove the 2 lower bolts "S" on the speed change housing "Q"
 - g. Separate the upper housing "T". Because the housings are pinned together, it may be necessary to use a soft mallet to separate them.
 - h. After replacing the belt, reverse the above order to re-assemble.

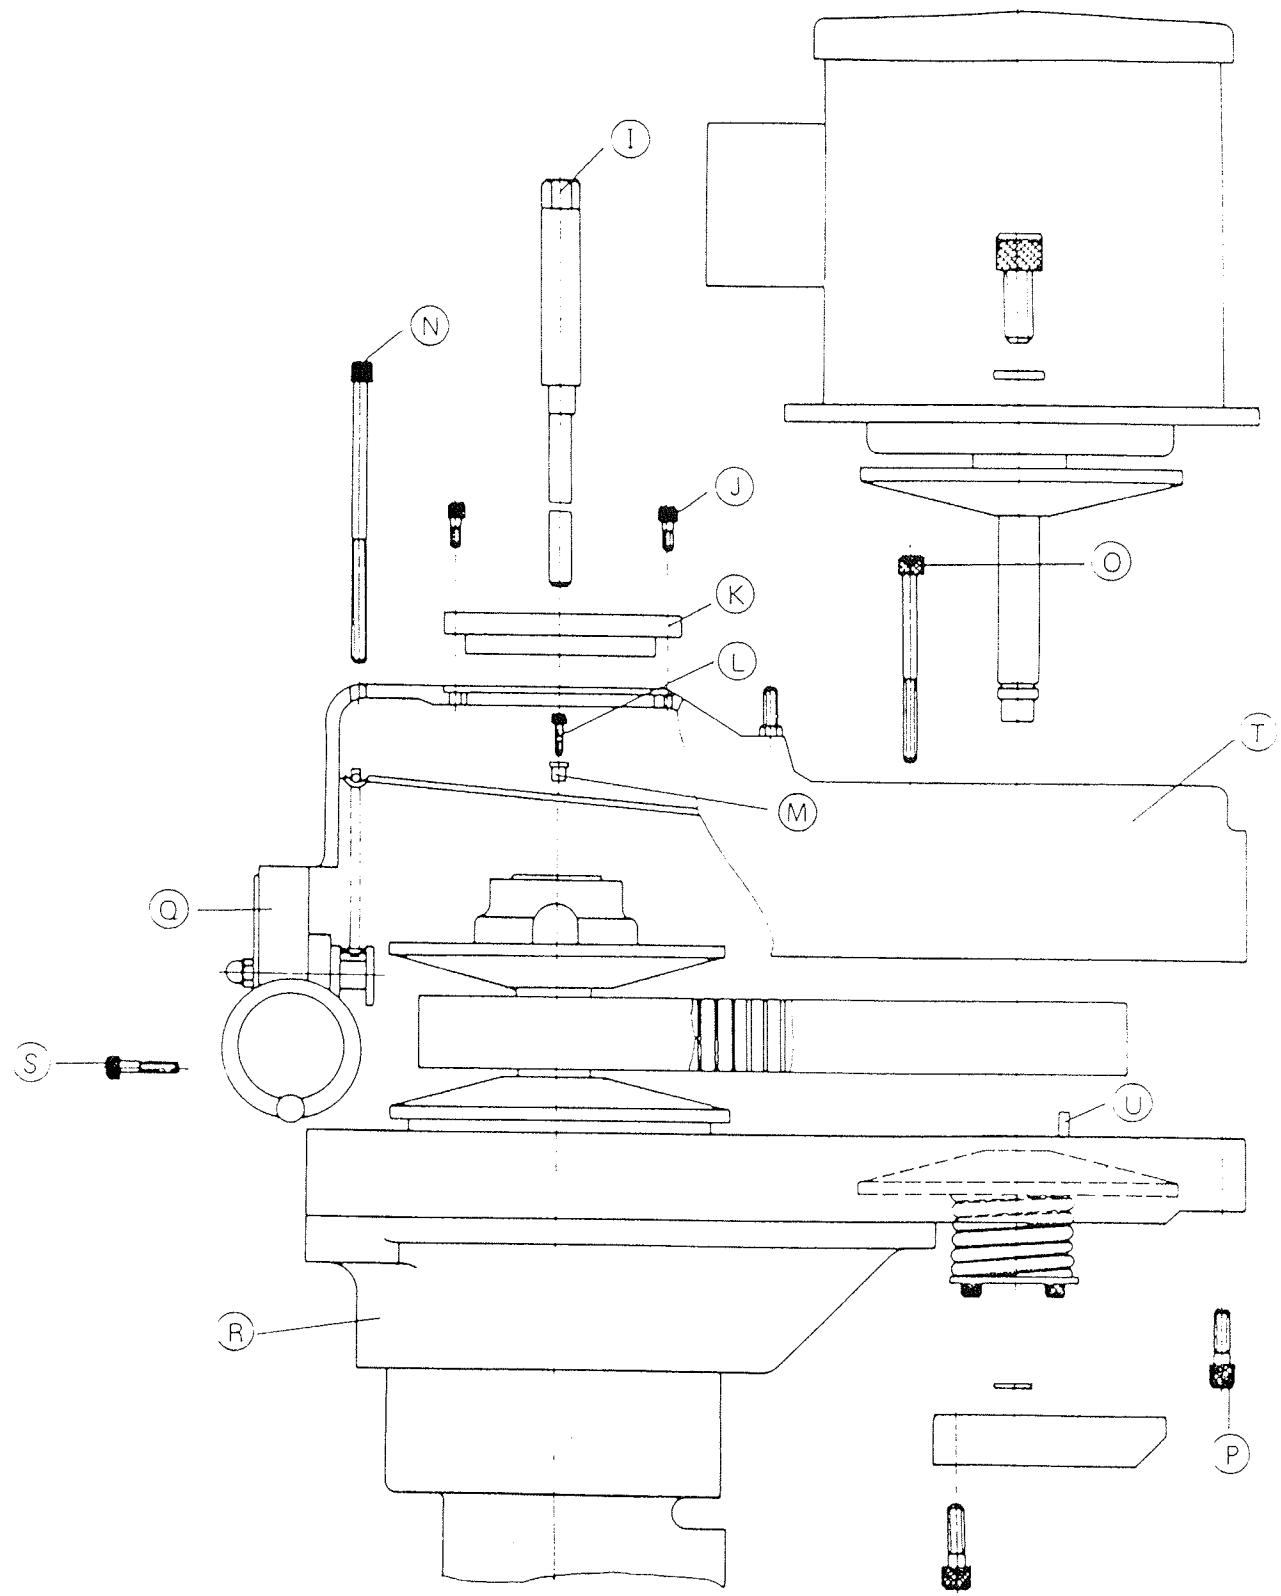

Figure 26

3. Brake Block Replacement (Fig. 27):

- a. Refer to steps a to g on page 24 and steps b to g on page 26.
- b. Remove the four bolts "V" (Fig. 28) so housing "T1" can be removed. It may be necessary to use a soft mallet. (Housings "T1" and "R" are pinned together).
- c. Remove vari-disk assembly set "E1" (Fig. 27) by removing bolt "X". Brake block "Y" can now be replaced.
- d. Reverse above order to re-assemble.

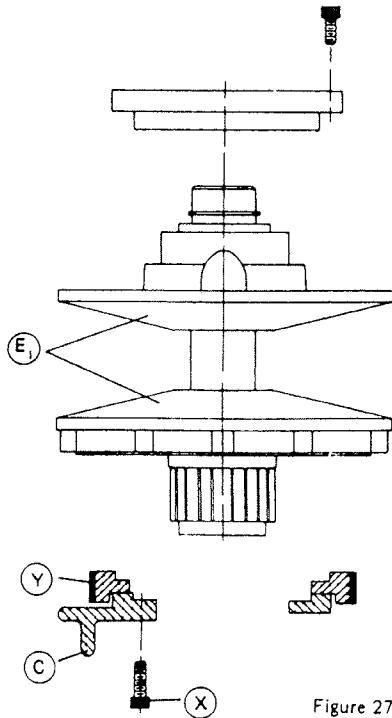

Figure 27

4. Replacing Timing Belt:

- a. Follow disassemble procedures outlined in steps a to g on page 24 and steps b to g on page 26 and steps b to on page 28.
- b. Change the timing belt as shown in Fig. 28
- c. Reverse above order to re-assemble.

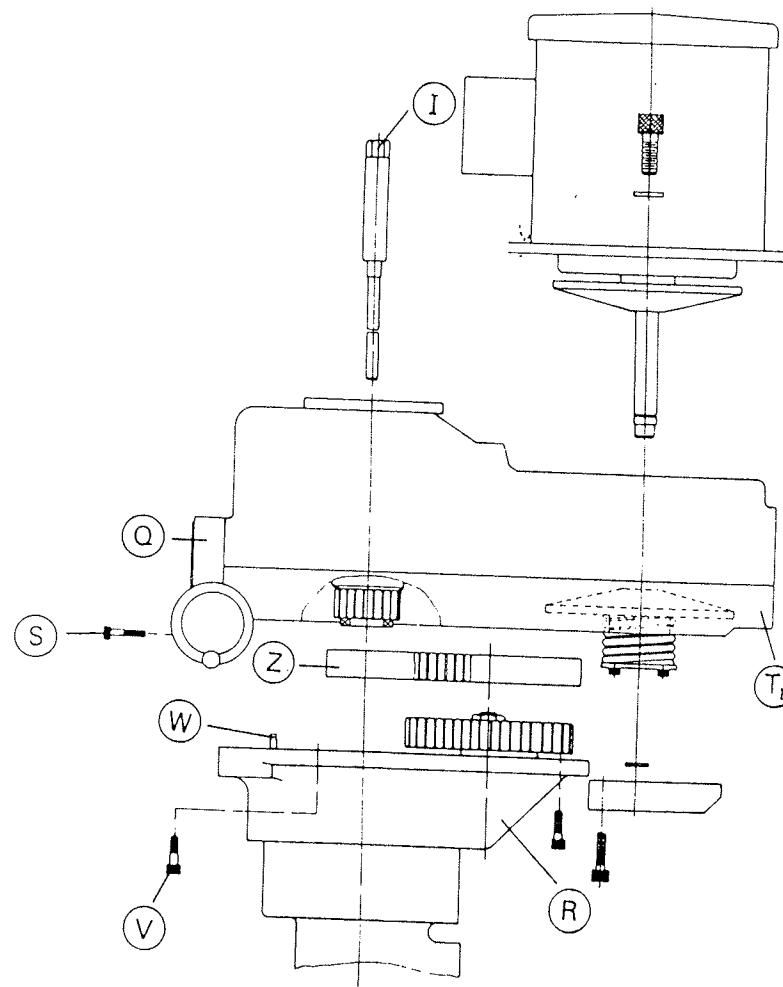

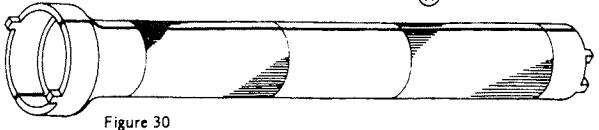

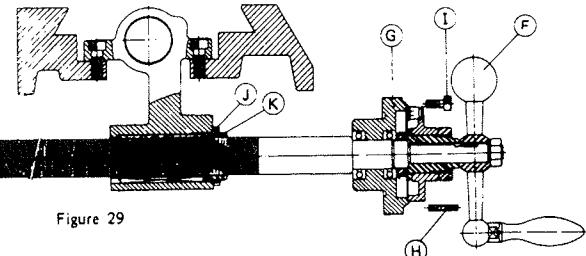

Figure 28

5. Adjusting leadscrew backlash:

A. Y axis Backlash adjustment:

- a. Move saddle to the middle of its travel.
- b. Remove 4 bolts "I" on bearing bracket "G".
- c. Lock saddle and turn hand crank "F" clockwise to separate bracket "G" from the Knee.
- d. Unlock saddle and move screw until adjusting tool fits into the space.
- e. Use the large end of the tool to loosen the lock nut "J". (Counter clockwise).
- f. Turn adjusting nut "K" with the small end of the tool to reduce backlash. (Clockwise).
- g. Using the large end of the tool, tighten lock nut "J".
- h. To re-assemble, turn hand crank "F" counter clockwise to seat

bracket "G" to the knee, being careful to align the pins and replace bolts "I" to complete the process.

Resulting backlash should be .003 to .004"

B. X axis Backlash Adjustment:

- a. Move the worktable to the center of the saddle.
- b. Insert large end of adjusting tool into the left side of the saddle and turn lock nut "J" counter clockwise approximately one turn
- c. Using small end of tool tighten adjusting nut "K".
- d. After adjusting nut "K", use large end of tool to re-tighten lock nut "J".

Resulting backlash should be .003 to .004".

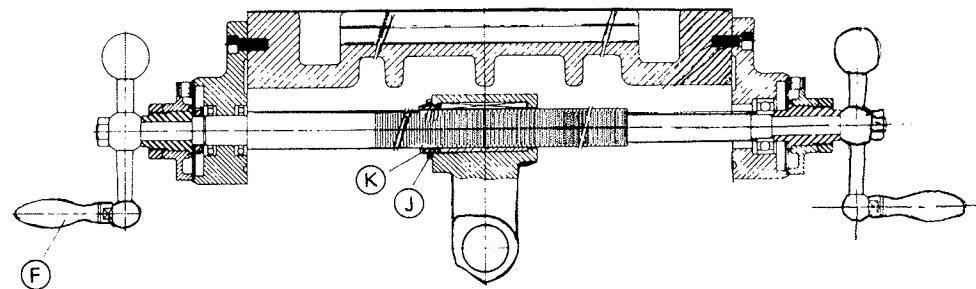

Figure 31

6. Adjusting Gibs:

After a period of time the gibbs may become loose or worn and may need to be adjusted to maintain the integrity of the mill.

A. Table Gib (Fig. 32):

The table gib is located between the saddle seat and the table dovetail.

- a. Loosen Lock levers "L".
- b. Clean and lubricate slideways.
- c. Using a screwdriver adjust the gib screws "M", located on both sides of the saddle. If when moving the table it feels loose, it can be adjusted by:

Slightly loosen the adjusting screw on the right, then tighten the left screw. After adjusting, check movement of table, if still loose repeat process until desired fit is obtained.

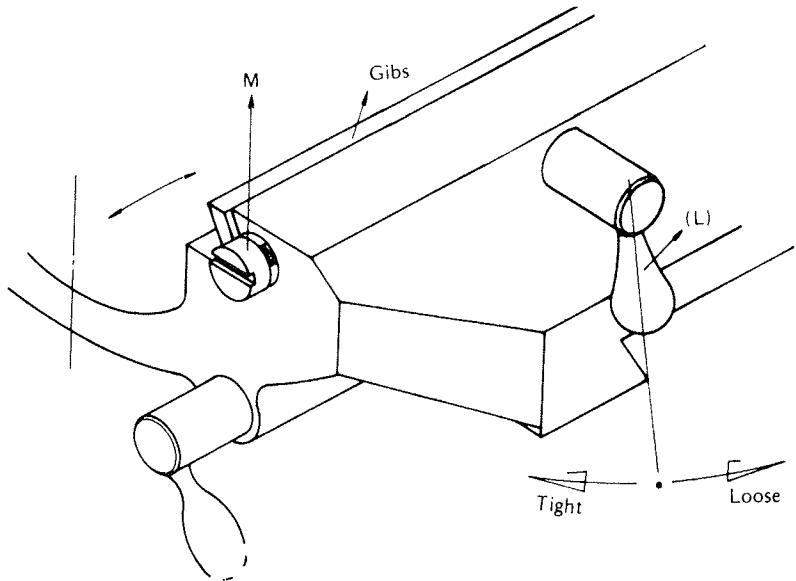

Figure 32

B. Saddle Gib (Fig. 33)

The Saddle gib is located between the left side of the saddle and the knee dovetail and can be adjusted as follows:

- a. Loosen saddle lock "A".
- b. Move saddle to the front of the knee.
- c. Remove wiper holder "B" on saddle.
- d. Clean and lubricate the slideways.
- e. Adjust the gib using the same method used on the table.
- f. After adjusting replace the wiper holder "B".

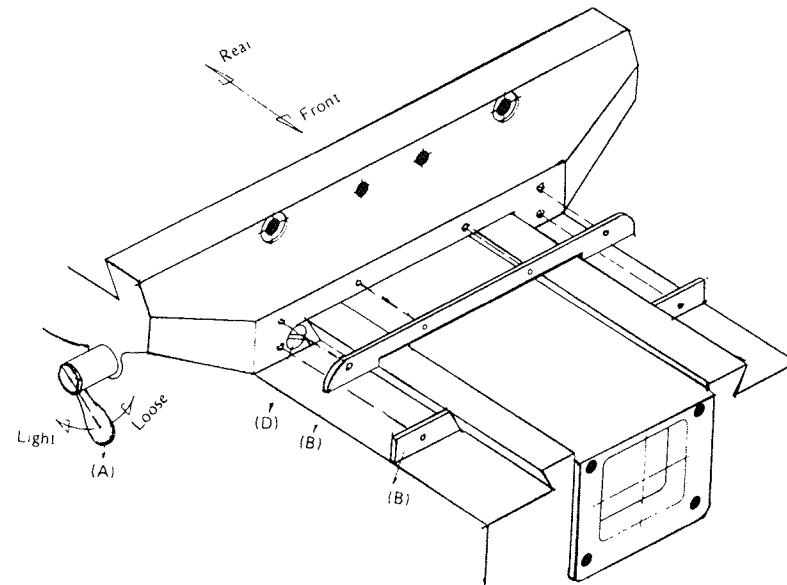

Figure 33

C. Knee Gib. (Fig. 34)

The knee gib is located between the left side of knee and the column dovetail and can be adjusted as follows:

- a. Loosen the knee clamp (Fig 5, Page 5).
- b. Remove Wiper holder "Q".
- c. Clean and lubricate slideways.
- d. Raise the knee to its uppermost position.
- e. Adjust the Gib screw "R" using the same method as used on the table.
- f. After adjusting, replace wiper holder "Q".

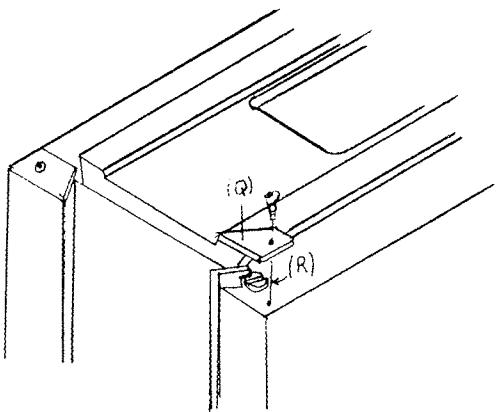

Figure 34

D. Ram Gib Fig. 35:

The ram gib is located between the ram and the turret dovetail.

- a. Loosen ram lock lever "C".
- b. Clean and lubricate slideways.
- c. Loosen lock nuts on gib adjusting screw "I", adjusts gib and retighten lock nuts.

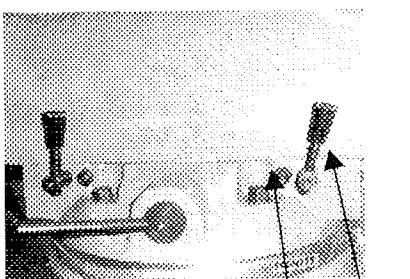

Figure 35 (I) (C)

4. Collet Alignment Screw Replacement (Fig. 36):

- a. First mark the location of the nose piece "B" to its position to the quill "A".
- b. Remove set screw "C", located on the nose piece. Remove the nose piece by inserting an adjustable spanner in the two holes in the bottom of the nose piece.
- c. Remove set screw "D", insert a collet in the spindle and adjust set screw "D". First screw it in until it contacts the collet, then back it off approximately $\frac{1}{4}$ turn to allow 0.25mm (0.01") play.
- d. If collet fits properly, replace set screw "D" and replace the nose piece. Be sure to tighten so that the mark made in step "a" line up.

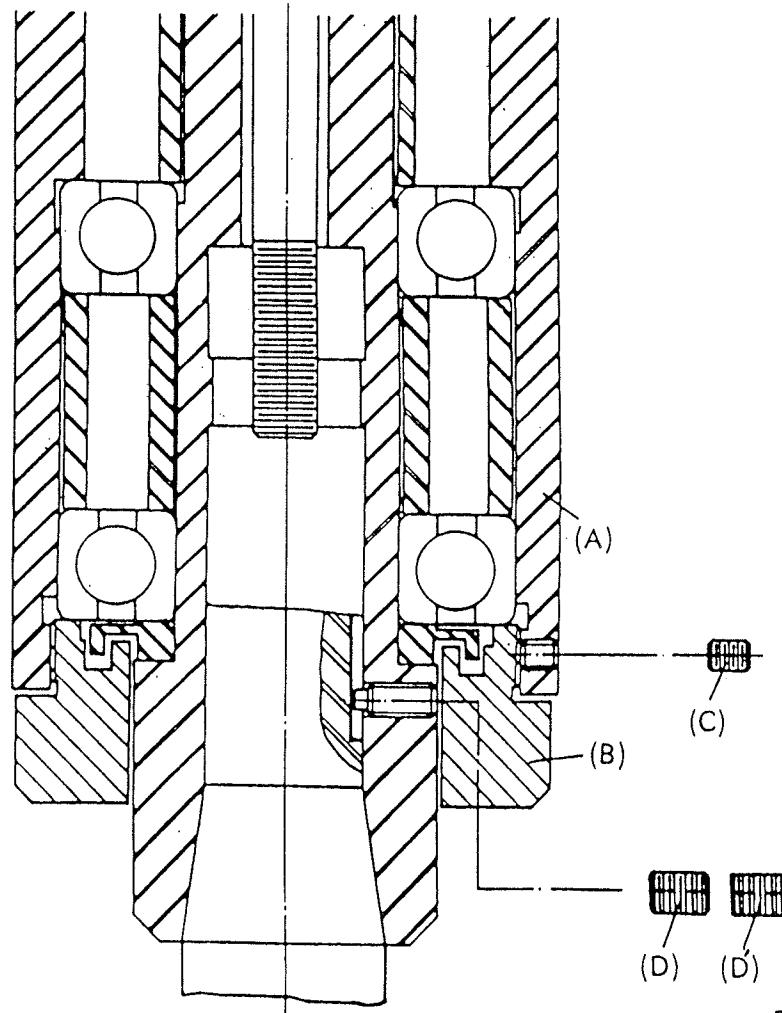

Figure 36

10 Maintenance:

“ Maintenance is more important than repair and repair is better than purchase”

The life of a machine can be greatly reduced if it has not been properly maintained and operated. The result will be premature wear, inability to hold tolerances and poor finish on the workpiece. It is essential that the operator be familiar with the operation and maintenance of the machine.

Daily Maintenance:

1. Check oil level in the pump. (Manual)
2. Lubricate machine per lubrication charts on pages 7 & 8.
3. Run machine at 1200 RPM for 2 to 3 min. prior to operation. This is to allow the belts to stabilize.
4. At the close of each day:
 - a. Workpiece should be removed, (if practical) and work table cleaned and oiled.
 - b. All machine locks should be loosened and sliding parts lubricated. If practical remove cutter.
 - c. Headstock should be returned to its normal position, if it has been operated in a tilted position.

Monthly Maintenance:

- a. Check all clamping rails and sliding surfaces for wear.
- b. Check leadscrew backlash. (Adjust if needed).
- c. Check quill lock and other moving parts for proper operation.

Quarterly Maintenance:

- a. Check brake and belts.
- b. Check if the table is square with the head.
- c. Do a general test of the machine, checking for worn parts and replace as needed.

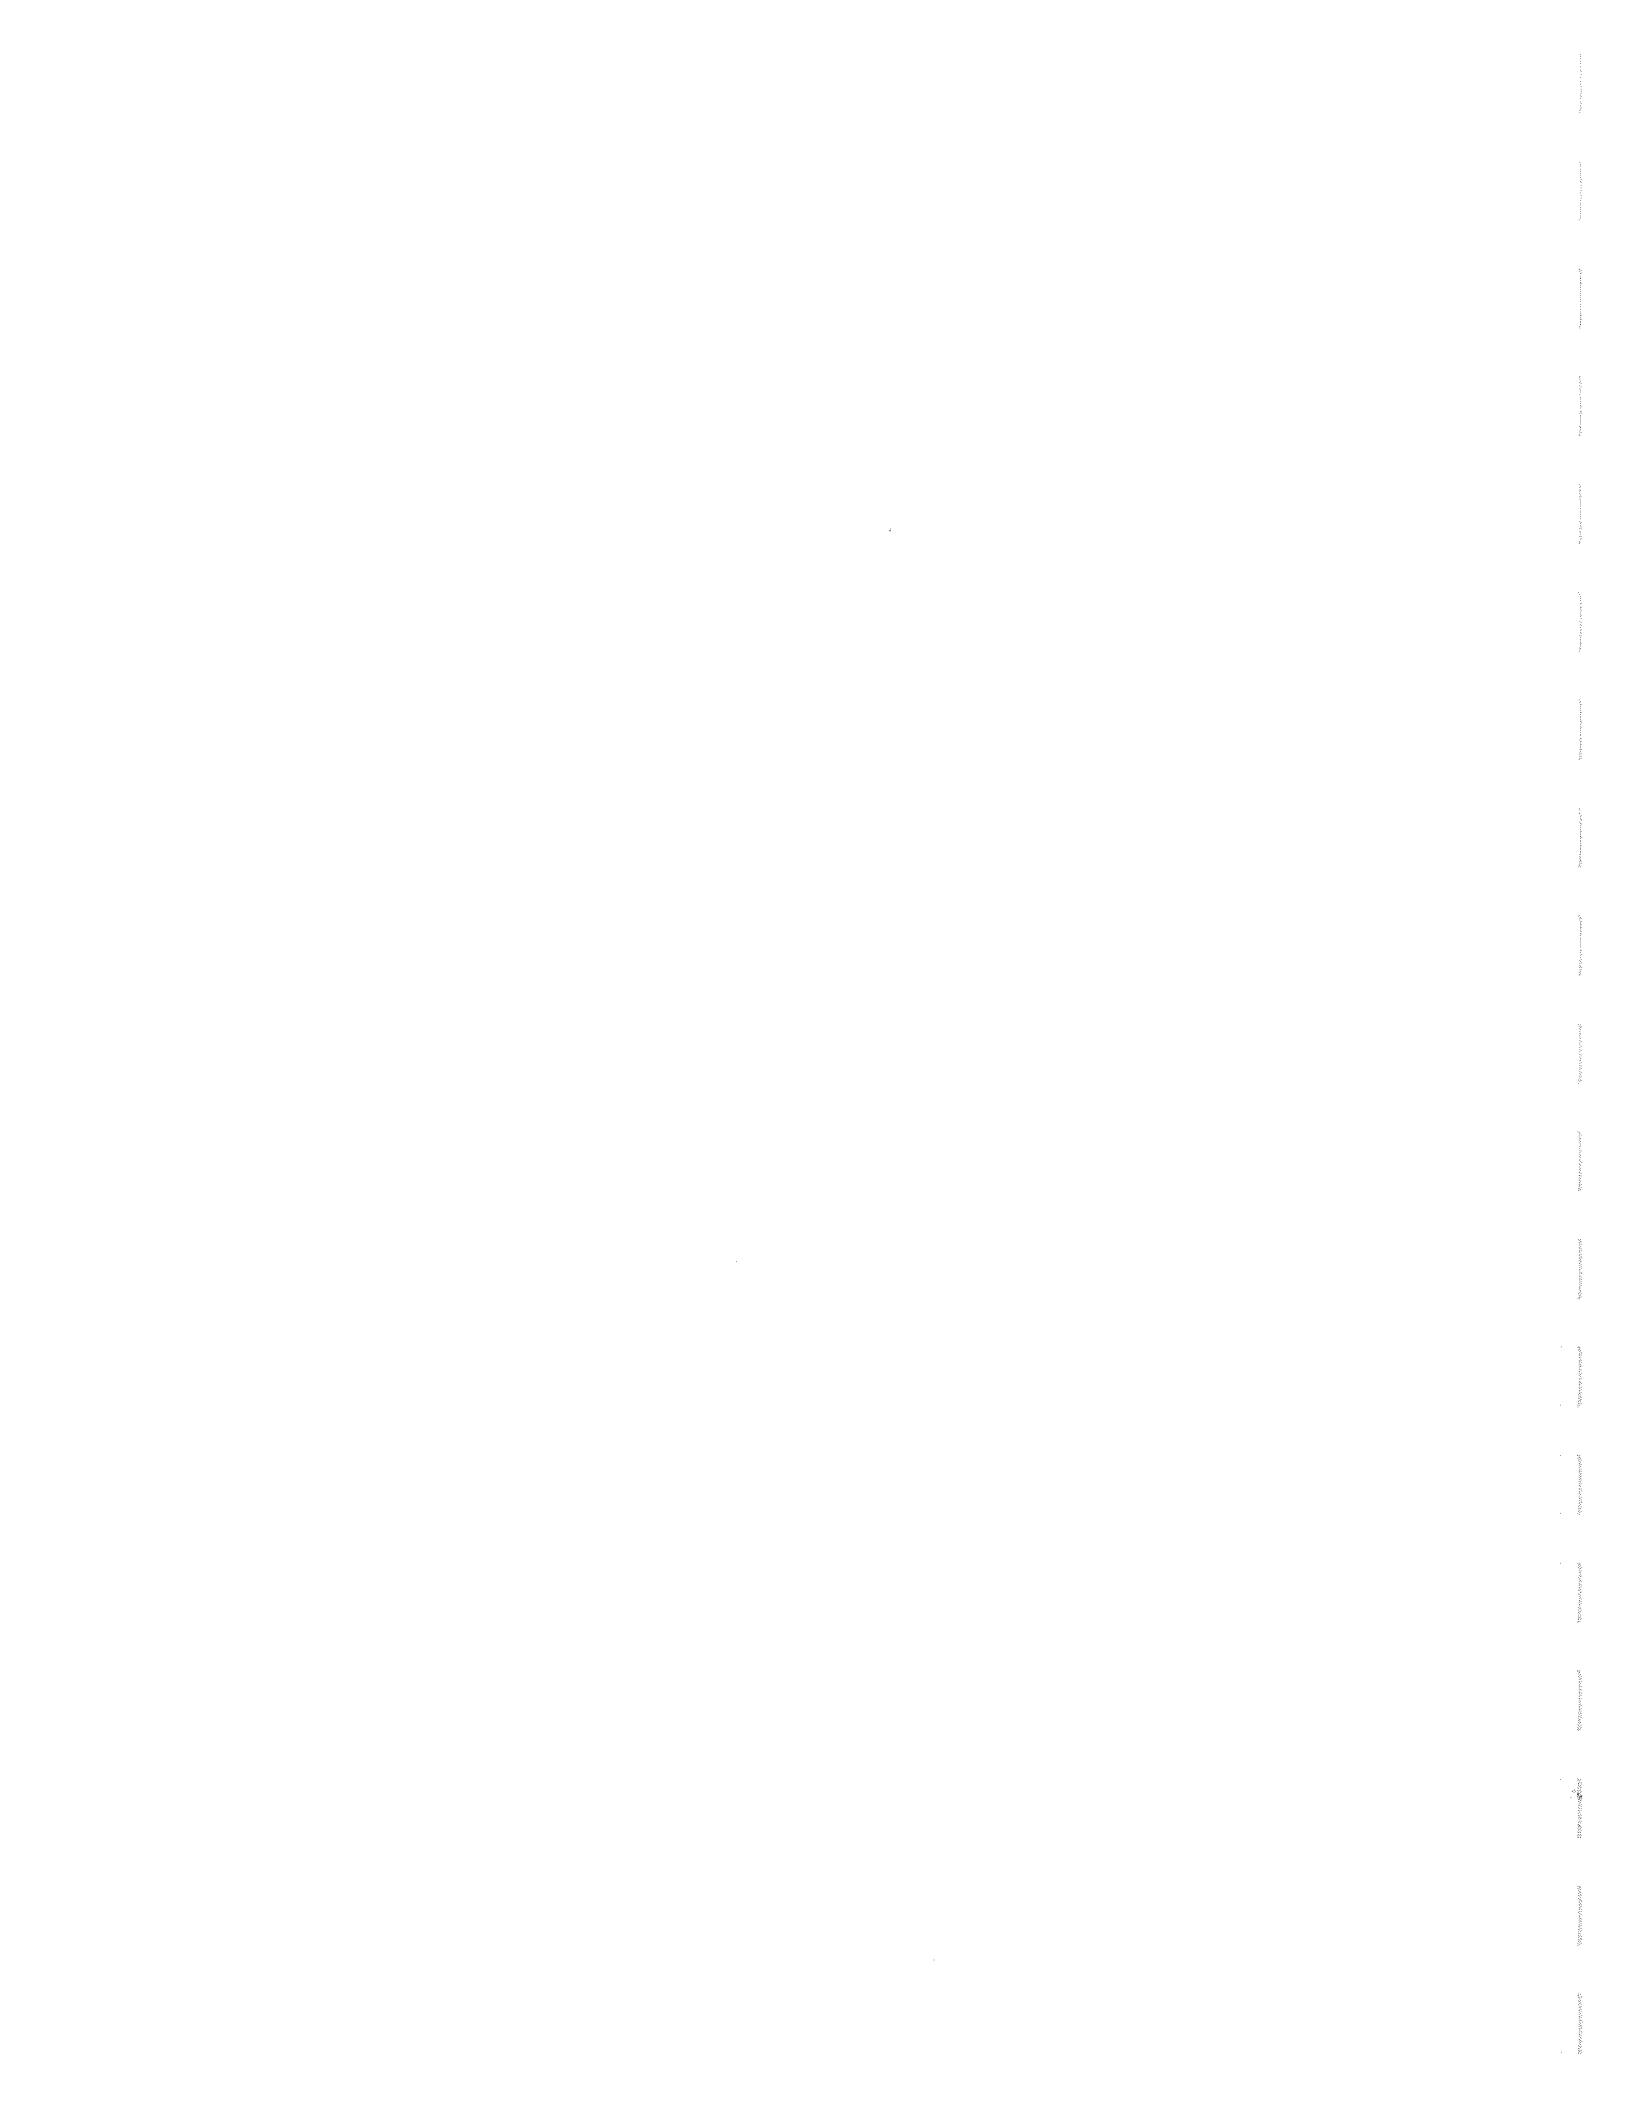

12. Notice:

1. Machine Operation:

- a. Machine must be installed on a solid base.
- b. Be sure the machine's base and the surface have proper contact before tightening the anchor bolts.
- c. Be sure the motor voltage conforms to the source voltage and properly grounded.
- d. Turn off machine before changing gears.
- e. Be sure cutter or tool is clear of the workpiece before starting or stopping the machine.

2. Machine Operator:

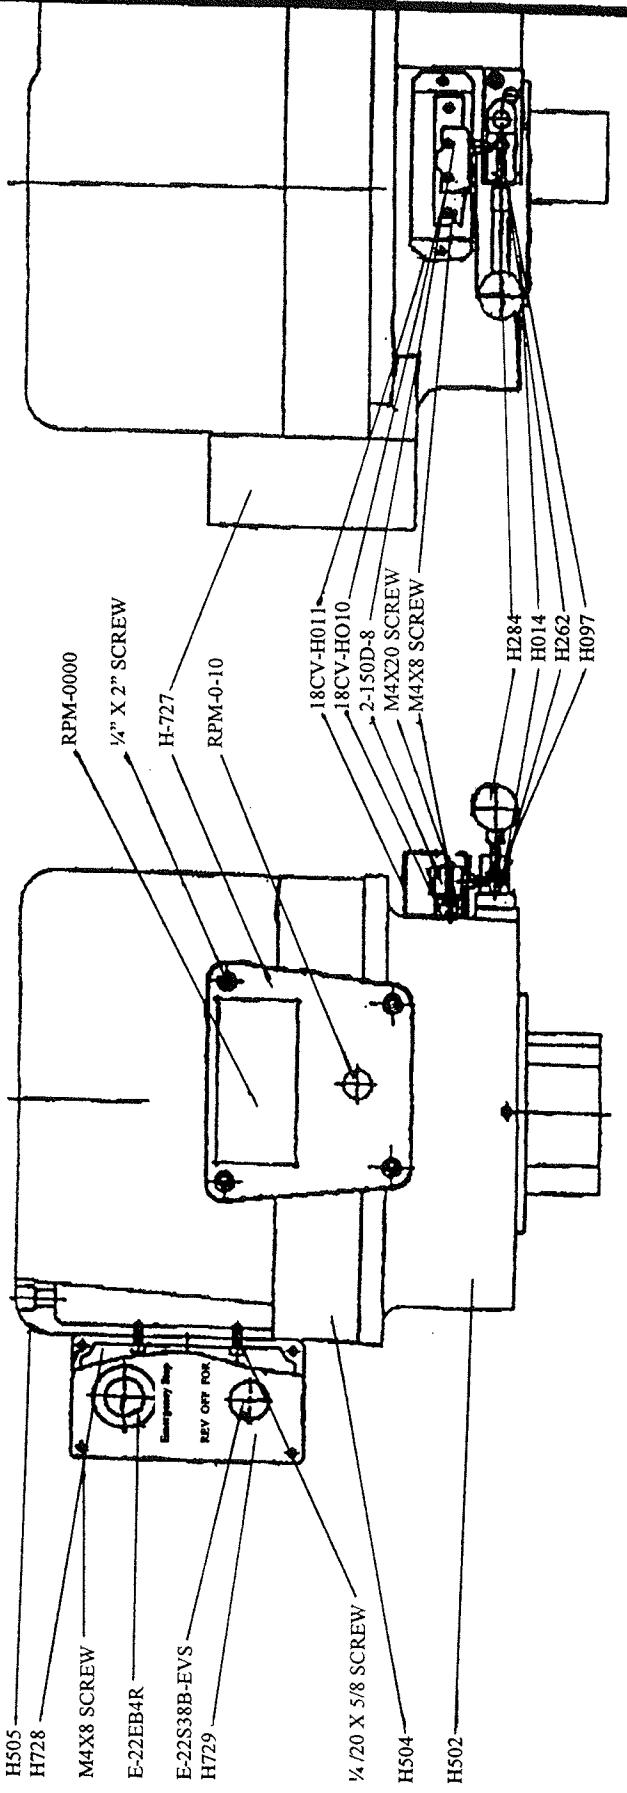

- a. Only authorized personnel should operate Mill.
- b. If a problem is suspected, stop the mill immediately, check for the problem and make any repairs or adjustments that may be required.
- c. Auto feed lever must be in neutral before starting mill.
- d. Stop machine when inspecting tool or workpiece.
- e. Be certain that workpiece is properly clamped prior to machining.
- f. Spindle must be kept clean and lubricated at all times.
- g. Keep tools and other objects off of the table to eliminate damage or nicks.
- h. Make sure spindle is up to speed before starting the machining operation.
- i. Use a brush to remove chips.
